NEOSTRATA CHEMICAL PEEL

A Glycolic acid peel is a treatment for skin renewal, performed under the supervision of a dermatologist. This procedure rapidly removes the accumulative dull layer of surface skin cells, revealing fresh skin and stimulating cellular renewal.

Skin improvements as a result from a chemical peel series:

- Softening of fine lines
- Diminution of coarse lines
- Increased smoothness in skin texture
- Mild to moderate smoothing of acne scars
- Lightening of pigmentation irregularities
- Increasing skin radiance
- Some minimization of pore size

Neostrata home care products (contain AHA= alpha hydroxy acids, PHA= poly hydroxy acids) can be used to intensify results. These active ingredients provide a smoothing and anti-wrinkle benefit and are non-irritating.

It is clinically proven that Neostrata products used in a daily routine reduce the appearance of fine lines and wrinkles.

Some of the Neostrata products contain Lacto bionic acid, which is a potent anti-oxidant and highly moisturizing.

Amount of healing time needed after the treatment:

No down time needed. The flexibility of the Neostrata Skin Rejuvenation System takes into consideration the condition that the peel is being used for, the degree of improvement wanted, the time to achieve it and the acceptable amount of discomfort and the acceptability of possible scabbing.

Initially your skin may be somewhat red and puffy. It may take up to one week for the renewal and rebuilding process to allow your skin appearance to return to "normal". During this repair period some patients can experience slight stinging, burning, tightness, sun sensitivity and peeling of the superficial layers of skin.

There can be some crusting and this should be allowed to heal naturally.

Book a complementary skin consultation with our skin therapist. She will go through all your unanswered questions.
